

Customer Segmentation Project

Segment customers based on behavior and demographics

Customer segmentation is the process of dividing customers into groups based on demographics, purchasing behavior, interests, and preferences. This project helps businesses understand customer needs and improve marketing strategies through targeted campaigns.

Key Features

- Perform clustering using Python (Scikit-learn) or Power BI.
- Analyze purchase patterns and customer preferences.
- Visualize customer segments and key characteristics.
- Identify high-value customers for personalized marketing.

Customer Segment Analysis

Segment	Characteristics	Marketing Strategy
Premium Customers	High spending and loyal customers	Exclusive offers and loyalty rewards
Regular Customers	Frequent buyers with average spending	Discounts and personalized recommendations
Occasional Customers	Infrequent purchases	Promotional campaigns and reminders
New Customers	Recently joined customers	Welcome offers and onboarding support

Customer Segment Distribution

Expected Outcome

Gain experience in customer analytics, segmentation, and targeted insights. Businesses can use these insights to improve customer engagement, increase sales, and optimize their marketing campaigns.

Conclusion:

Customer segmentation enables businesses to understand different customer groups and create personalized strategies for each segment. This project demonstrates how data analysis and segmentation techniques can support business growth and improve customer satisfaction.
